

Technical Assignment Report

Topic: Apache OFBiz Company, Product Store, and Catalog Setup

Prepared By: Adarsh Raghuwanshi

Date: May 15, 2026

This document details the step-by-step technical implementation of a new product catalog, company profile, and product store within the Apache OFBiz ERP framework. The assignment involved backend entity configuration and frontend verification on the eCommerce application.

1. Company Profile & Role Configuration

The foundational step involved establishing the root organizational entity and assigning the necessary operational roles to facilitate B2B and B2C transactions.

1.1 Party Creation

A new Party Group was created using the Party Manager application.

Attribute	Value
Party ID	ADARSH_COMPANY
Group Name	Adarsh Company
Status	Enabled

Figure 1: Successful creation of the ADARSH_COMPANY party profile.

1.2 Role Assignments

To ensure proper access and operational capabilities across supply chain and sales, the following standard OFBiz roles were successfully linked to ADARSH_COMPANY:

- Bill-From Vendor
- Bill-To Customer
- Internal Organization
- Ship-From Vendor
- Supplier & Supplier Agent
- Vendor

Figure 2: Role assignments successfully added to the company entity.

2. Product Store Initialization

A new logical retail entity was constructed to handle catalog serving and order processing settings.

Attribute	Value
Product Store ID	ADARSH_STORE
Store Name	Adarsh Store
Primary Store Group	Adarsh Store Group [ADARSH_STORE_GROUP]
Inventory Facility	Web Store Warehouse [WebStoreWarehouse]

Figure 3: Product Store (ADARSH_STORE) configured with specific inventory and group settings.

3. Catalog & Category Setup

A specialized catalog was designed and mapped to both the store and hierarchical categories to structure the frontend navigation.

3.1 Catalog Association

A new catalog named **Summer Catalog** (ID: SUMMER_CATALOG) was initialized and bound to the primary OFBiz E-Commerce Store (ID: 9000). This linkage ensures the catalog is eligible for display on the public storefront.

Figure 4: Summer Catalog mapped to the active eCommerce Product Store.

3.2 Category Linkage

The catalog was populated with distinct categories to organize the products effectively:

Category ID	Category Name	Association Type
SUMMER_MEN	Summer Men Category	Browse Root & Default Search
PROMOTIONS	PROMOTIONS	Promotions

Figure 5: Hierarchical categorization implemented under the Summer Catalog.

4. eCommerce Frontend Verification

The final phase involved testing the integration on the user-facing storefront to confirm data synchronization between the backend Catalog Manager and the eCommerce plugin.

Verification Status: SUCCESS

The eCommerce keyword search functionality was executed under the selected "Summer Catalog". The system successfully retrieved and displayed products mapped to the SUMMER_MEN category. Specifically, the items "Cap with hotel Logo" and "Jalapenos" rendered correctly with their respective Add-to-Cart and Compare configurations active.

Figure 6: Live eCommerce frontend correctly displaying the configured catalog and its associated products.

Conclusion

The assignment objectives have been fully met. The ADARSH_COMPANY was successfully instantiated with accurate roles, a dedicated product store (ADARSH_STORE) was configured, and the custom SUMMER_CATALOG is fully functional and serving categorized products to the eCommerce frontend layer.
